

LabStats User Obfuscation

User obfuscation can be employed at universities where computer accounts have usernames that are personally identifiable. For example, a user name "Jane Doe" would be identifiable via a username of "jane.doe" so user obfuscation could be employed as a preventative measure.

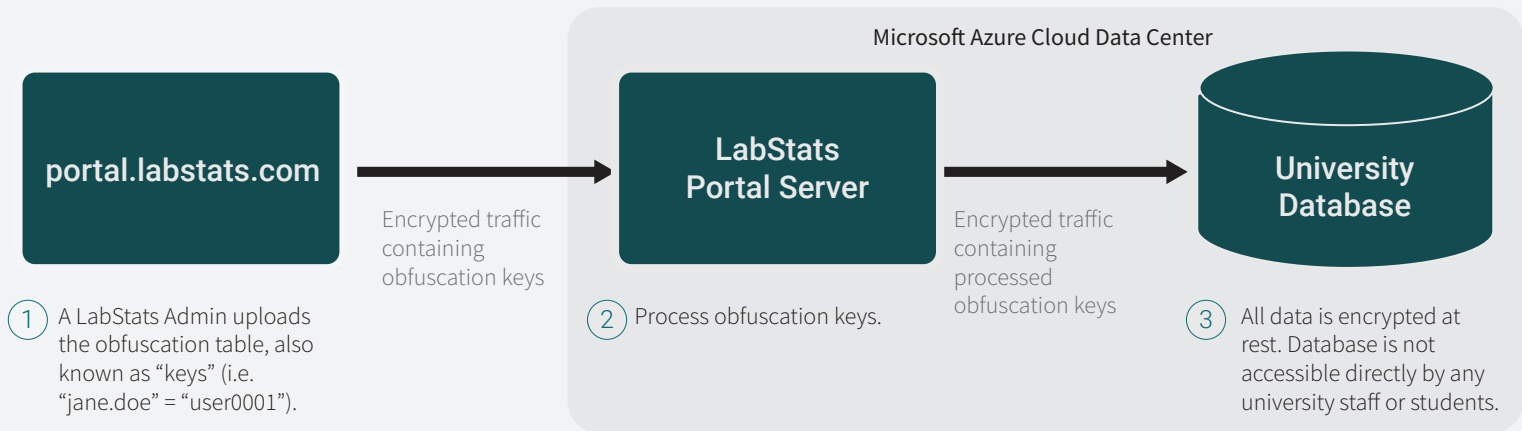

STANDARD PROCESS

LabStats usage tracking follows a standard process, regardless if user obfuscation is employed or not. By default, user usage data in LabStats is attributed to the subject user.

ENABLE USER OBFUSCATION

Universities may enable user obfuscation to prevent users from being identifiable within LabStats.

OBFUSCATED PROCESS

User obfuscation, when enabled, prevents identifiable attribution.
